

## More than One in Five Delaware Adults Now Use Tobacco Products

Cigarette smoking prevalence among Delaware adults held steady at **17 percent** (confidence interval of 15.2 - 18.8 percent) in 2017, according to the Delaware Behavioral Risk Factor Survey (BRFS). This is statistically the same as the 2016 prevalence of 17.7 percent.

However, when considering all the other forms of tobacco currently being used, **total tobacco use prevalence is now 22.3 percent of adult Delawareans** (down slightly but not significantly from 24.2 percent in 2016).

**More than half (57.9 percent) of Delaware adults now say they have never smoked.** Another **25.1 percent** of respondents were former smokers. The BRFS defines "current smoker" as anyone who smokes every day or some days during the week. Only **11.2 percent** of respondents say they smoke cigarettes every day; while **5.8 percent** call themselves "some-day smokers." The "some-day smokers" group includes younger adults who are just starting to smoke, but also includes smokers who are cutting back or trying to quit.

A majority of smokers (**65.6 percent**) said they had **tried to quit smoking during the past year**.

There were no statistically significant differences in smoking prevalence by county.

Cigarette Smoking by County, 2017

	Statewide	New Castle County	Kent Co.	Sussex County
<b>Current Smokers</b>	<b>17%</b>	<b>15.9%</b>	<b>18.2%</b>	<b>18.9%</b>

Although men have a slightly higher smoking prevalence (**17.9 percent**) than women (**16.2 percent**), the difference is not statistically significant when confidence intervals are considered. There are also no statistically significant differences by race or ethnicity.

Smoking has significantly decreased over the past decade among 18-24 year old adults, at least partly because smoking had decreased among high school students who have now entered the adult sample. In 2017, only **13 percent** of respondents in the 18-24 age group reported smoking cigarettes (down from 26.9% a decade ago). The age group with the highest cigarette smoking prevalence (**26.2 percent**) is now adults between the ages of 25 and 34. Only **7.7 percent** of adults age 65 and older are smokers.

Although the BRFS does not ask at what age adults initiated smoking, the Division of Public Health conducts a companion survey called the Adult Tobacco Survey (ATS). According to the 2016 ATS, among adults who currently smoke, 76 percent first

tried smoking before age 18, and 20.5 percent first tried smoking after they turned 18 but before age 21. Only 3.5% of Delaware adults first tried smoking after age 21.

## Higher Risk

Some groups of adults have a significantly greater risk of becoming smokers, including people with disabilities and with depression or other mental health conditions.

Among adults reporting a significant number of "poor mental health days" each month, **33.7 percent** are smokers, compared to only 14.5 percent of adults who reported no or few poor mental health days. Likewise, **33.3 percent** of adults who reported depressive disorders smoke cigarettes, compared to 13% of adults without depression.

Among adults reporting any kind of disability, **25.6 percent** were smokers, compared to 13.2 percent of adults without disabilities.

By income level, the highest smoking prevalence (**32.1 percent**) is among adults with an income of less than \$15,000 per year, according to the BRFs. The best predictor of smoking is educational level. While **28.4 percent** of adults with less than a high school education smoke cigarettes, only **6.5 percent** of adults with a college degree are smokers.

## Other Tobacco Products

The tobacco industry has introduced and heavily marketed a number of new tobacco products during the past decade, most of which have the same health risks as cigarettes. Measuring the use of these other tobacco products is, therefore, as important as measuring prevalence of cigarette smoking. Other tobacco products include cigars, little cigars or cigarillos, smokeless tobacco, hookahs, pipes, bidis, kreteks, orbs, and strips. These products are more popular among men and young adults.

**Little cigars** have become more popular, with **5.3 percent** of Delaware adults saying they were current cigar or little cigar smokers during 2017.

**Smokeless tobacco** includes traditional products such as chewing tobacco and snuff, but more recently also includes snus (pronounced snooze). Snus is flavored tobacco powder in teabag-like packets that are held between the lips and gums and do not require spitting. Smokeless tobacco is not popular among women; only about 1 percent use it. However, **4.7 percent** of men report using smokeless tobacco. Use is highest (**9.8 percent**) among young men age 18 to 24.

## Electronic Devices or e-Cigarettes

Among teenagers, experimentation with electronic or e-cigarettes became very popular, starting about 2015. According to the 2017 Youth Risk Behavior Survey of public high school students, **13.6 percent** of students had used e-cigarettes in the past month, and **1.9 percent** were smoking or "vaping" e-cigarettes daily.

Experimentation with e-cigarettes is also catching on with adults. According to the 2017 BRFS, about **4.8 percent** of Delaware adults currently use e-cigarettes, about the same prevalence as the 2016 survey. However, **12.7 percent** of 18- to 24-year-old adults are "current users" of e-cigarettes, and **21.3 percent** of males age 18-24.

In 2017, **more than half of the adults who "vaped" e-cigarettes (56.4 percent) also were current smokers**, thereby increasing potential harm. Among current smokers, **28.6 percent** also used e-cigarettes at least some days of the week.

## Total Tobacco Use

While 17 percent of Delaware adults smoke cigarettes, the total percent of adults who use any tobacco products is significantly higher. The Delaware BRFS has calculated "total tobacco use" based on reported use of cigarettes, cigars, little cigars, e-cigarettes, smokeless tobacco, hookahs, and other tobacco products. The formula takes into account the fact that many adults use multiple types of tobacco products.

The **total tobacco use prevalence** for 2017 is **22.3 percent** — more than one-fifth of the state's adult population.
